

THE HIDDEN WORLD OF AI

From Data Centers to Everyday Intelligence

T.G Sravan Teja | 261FB04042 | 1ST MTech - CSE

The Intelligence Behind the Screen

- AI may appear as an app, chatbot, or recommendation on your screen, but it depends on physical computing infrastructure behind the scenes.
- Servers – run AI models and process requests
- GPUs & AI Accelerators – perform large numbers of calculations efficiently
- Data Storage – stores training data, models, and other information
- High-Speed Networks – move data between systems
- Cooling & Power Systems – keep the infrastructure running safely

Every digital AI experience is supported by a physical infrastructure of computing, storage, networking, power, and cooling.

DATA

AI receives examples such as text, images, audio, numbers, or other information.

TRAINING

A model learns patterns and relationships from the available data.

AI MODEL

The trained model stores what it has learned in a form that can be used to process new inputs.

INPUT

A new question, image, sound, or other information is provided to the model.

OUTPUT

The model produces a prediction, classification, recommendation, or generated response.

How AI helps people

EDUCATION

Personalized learning, study assistance, and feedback.

HEALTHCARE

Medical image analysis, research support, and clinical decision assistance.

BUSINESS

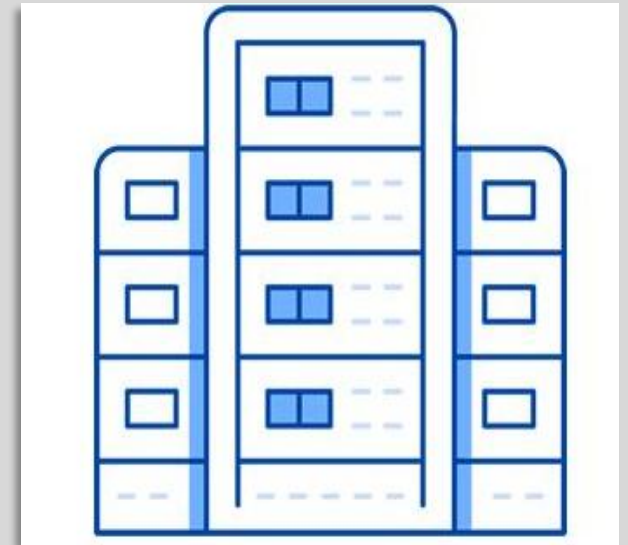

Data analysis, automation, customer support, and forecasting.

TRANSPORTATION

Route optimization, traffic prediction, and driver-assistance systems.

EVERYDAY TECHNOLOGY

Search engines, recommendations, voice assistants, and smart devices.

THANKYOU
