## AI-GENERATED MEETING NOTES

Sprint 11 Planning Meeting — Key Points, Decisions and Action Items

### Assignment

Record or use a sample meeting conversation and generate meeting notes using an AI tool; identify the key discussion points and action items. For this assignment, a sample meeting conversation was analyzed to produce structured meeting notes, decisions, and follow-up tasks.

### Meeting Overview

|              |                                                                                       |
|--------------|---------------------------------------------------------------------------------------|
| Meeting      | Sprint 11 Planning Meeting                                                            |
| Purpose      | Discuss database selection, checkout redesign, launch timeline, and current blockers. |
| Participants | Three speakers are present in the sample meeting.                                     |

### Key Discussion Points

- **Database selection:** MongoDB offered faster writes for the ingest path, but PostgreSQL provided cleaner reporting and analytics capabilities. Existing PostgreSQL expertise within the team also supported the decision.
- **Checkout redesign:** The complete redesign was estimated to take about three weeks, which was difficult to complete before the fixed launch date. A phased approach was discussed.
- **Launch and QA:** The QA environment had been unavailable for several days. The meeting also covered a Stripe transaction-limit issue and the need to check whether the checkout flow required legal review.

### Key Decisions

| No. | Decision                                                                                                            |
|-----|---------------------------------------------------------------------------------------------------------------------|
| 1   | Use PostgreSQL instead of MongoDB because reporting/analytics were important and the team had PostgreSQL expertise. |
| 2   | Use a phased checkout rollout: Phase 1 for the current launch and Phase 2 in Sprint 12.                             |

### Action Items

| No. | Action Item                                                                         | Owner      | Due              |
|-----|-------------------------------------------------------------------------------------|------------|------------------|
| 1   | Prepare and share the database migration plan.                                      | Marcus     | Friday           |
| 2   | Update the roadmap to reflect the phased checkout approach.                         | Unassigned | Today            |
| 3   | Follow up with Stripe about the higher transaction limit and escalate if necessary. | Marcus     | Today / Tomorrow |
| 4   | Check with legal about whether the checkout flow requires a review.                 | Unassigned | This week        |
| 5   | Escalate the QA environment issue to the platform team and get a fix committed.     | Marcus     | End of week      |

### Open Question

What will happen to existing customers with saved cards during the phased checkout rollout?

### Short Meeting Summary

The Sprint 11 planning meeting focused on database selection, checkout redesign, and launch blockers. The team decided to use PostgreSQL because of its reporting capabilities and existing team expertise. A phased checkout rollout was selected to support the fixed launch date. Follow-up tasks included preparing the migration plan, contacting Stripe, addressing the QA environment issue, and checking legal requirements.

## How AI Was Used

The meeting conversation was used as the input for an AI-based meeting-notes workflow. The workflow can be represented as: Meeting Recording → Transcription → AI Analysis → Key Points → Decisions → Action Items → Structured Meeting Notes. The purpose of AI in this task is to organize the conversation into concise, useful notes rather than reproduce the full conversation.

### Audio Source:

The sample meeting audio used for this assignment was obtained from the **Meeting Summarizer project on GitHub**. I would like to express my sincere gratitude to the project owner and contributors for making the sample meeting recording available for educational and demonstration purposes. The recording provided a useful basis for identifying the meeting's key discussion points, decisions, and action items and for demonstrating how AI can be used to generate structured meeting notes.
